

Marktplaats owns the supply and none of the affection. Every platform in this market builds for sellers. Nobody sells buyers a better way to find.

18.7M

live ads, 350,000 added every day

73%

of the Dutch online reuse market

1.2

out of 5 on Trustpilot, 4,379 reviews

61%

of Dutch consumers bought used last year

49%

a bicycle, 42% furniture. Both size constrained

€7–11

a month Dutch buyers already pay for alerts

Ten findings, five countries, one conclusion. Trust and logistics are won with capital. Discovery is won with software.

Search is the unfixed part

Dutch keywords only, unreliable attributes, opening bids shown as prices. What actually decides a purchase cannot be typed.

Every loud complaint is about trust

Fraud that survives reporting, protection charged either way, a chatbot instead of support, day one bans on new accounts.

Speed already sells here

MarktAlert, MPAlerts and Marktplaats Scanner charge €6.95 to €10.95 a month, and one already advertises AI filtering.

Price confidence is an open hole

No sold price data exists in this market. Our morning deal hunt already contains the machine that answers it.

The window is 12 to 18 months

Once Marktplaats ships its own assistant the question becomes distribution, and we lose that. The habit comes first.

UK: focus beat brand in four years

Vinted took 50 to 60% of UK C2C apparel on free to sell and one category. eBay fell to 10 to 20% and scrapped seller fees.

Germany: the rails win money and lose goodwill

Kleinanzeigen, 35M monthly users and about €300M revenue, with forced DHL shipping and protection users read as a tax.

Russia: escrow, delivery, then an assistant

Avito holds the money until the buyer confirms and refunds return postage. Every user gets an AI assistant in 2026.

China: touch the item, or build a place

Zhuanzhuan inspects phones in 66 steps. Xianyu has 209M monthly actives across 1.3M interest communities.

USA: discovery can be fun

Whatnot doubled to about \$8B GMV on live auctions, converting at 9 to 30% against 2 to 3% for a grid of thumbnails.

Three jobs to own, out of twenty five. Each one needs a rebuild of the incumbent's core, which is why it stays open.

Job one

See only what actually fits, and know why

Describe it in any language, with the constraints that decide it. Matches only, a one line reason each, and an honest count of what we hid.

Job two

Tell me first, and only when it really matches

A standing hunt that keeps looking and pings within minutes. This is the habit and the revenue. A one off search is a demo people visit twice.

Job three

Is this a good price, yes or no

A verdict with the comparables behind it. It turns a match into a decision, and every day of listings we observe makes it sharper.

Ten hypotheses, each with the number that kills it. Six on the product, four on getting Dutch buyers to show up. Twenty in the long version.

Hypothesis	What we measure	Target, and kill
The reason line is the product	Listing clicks with it shown against hidden	+25%, kill if flat
The rejected pile builds trust	D7 return when we say what we hid and why	+10pp, kill if negative
Hunts turn searchers into users	Hunt creation after results, D7 return by cohort	25% and 3x
Speed and relevance sell at €7	Paid conversion of active hunt users	5%, kill under 2%
A price verdict changes decisions	Seller contact clicks, plus one survey question	+20%, kill if it drops
Internationals are the beachhead	Engagement and referral by input language	1.5x and 2x
Dutch long tail SEO carries acquisition	Organic sessions from 200 listing and 25 price pages	5,000 a month by day 90
WhatsApp beats email for alerts	Open rate, on a channel 89% of Dutch adults use	70% against 35%
Category intent ads, never brand terms	Cost per created hunt on a €500 test	€3 or less
The morning deal hunt is acquisition	New visitors landing on finds pages, and their hunt rate	30% and 15%

One month, three people, one number that matters. Weekly retained hunters: people with a live hunt who opened a result in the last seven days.

Week	Designer	Engineer	Marketing
1 Measure the core	Five buyer interviews, two of them non Dutch. Result rows rebuilt around the reason line, mobile first.	PostHog events. A 50 wish golden set that prints precision, recall and cost per search. Fix what it shows.	Keyword map: 200 constraint pages, 25 valuation pages. Expat and niche forum conversations opened by hand.
2 Ship the hunt	One tap hunt creation, and the notification itself, legible in a lock screen glance. Hunts as rows.	Hunt storage and a 5 to 15 minute runner, gentle on the endpoint, filtering only new listings. Push and email.	First 60 SEO pages and 10 price pages live. Ten phone shot clips from the morning finds.
3 Price, and ask for money	The price verdict, a number and a word, comparables on tap. Paywall with the price in the button.	Comparables corpus from the daily pulls. A valuation that refuses to guess. Mollie and iDEAL at €7.	25 price pages live, first organic read, €500 ads test measured on hunts created, not clicks.
4 Make it hold	Fix the two worst funnel drop offs. Landing page with a real search as the hero. A design.md in the repo.	Alerting on dead hunts and model fallbacks. A quiet scam badge, measured before it gets loud. 2dehands as a second source.	Press push measured on D30, not sessions. Referral on the share link. Kill two channels, double one.
